

Shamir's Freeform® Family

PRODUCT INFORMATION

SHAMIR Autograph II®

Autograph II® gives your patients a lens that's personalized to their optical measurements and prescription needs. These parameters are integrated into a state-of-the-art computation process using EyePoint Technology® and Prescriptor® software, which specifically calculate lenses for the wearer before the final production process. There is a whole lot of technology that goes into each Autograph II® lens. Not only is it available in fitting heights from 11mm and up, but each Autograph II® design is made to fit the patient's lifestyle.

Additional Info:

Available in 5 lifestyle designs
Available in variable and fixed designs

Fitting Height:

11mm and up & Single Vision

SHAMIR spectrum™

Spectrum™ gave us the opportunity to widen the reading area and corridor width to provide more comfortable vision zones for your patients. How wide are they? Compared to Element™, we've been able to increase the width by up to 20% (now that's wide). But wait, we're not done. What's vision without stability? Unstable. So our R&D team decided that patients deserved a little more power stability in the far vision zone. Did we mention that Spectrum™ features all these upgrades in a soft design?

Additional Info:

Available in 2 designs

Fitting Height:

14mm, 16mm, 18mm
Single Vision

SHAMIR element™

With Element™ your patients get a semi-personalized progressive lens made just for them. So what does semi-personalized mean? Well, Element™ doesn't have all the same bells and whistles that Autograph II® does, but the design is still personalized based on some of the patient's own measurements (Rx, PD, seg height, frame measurements) and the design and Rx are still on the back-surface of the lens. It's a reasonably priced alternative to the Autograph II® that still allows for a semi-personalized lens, created to the highest level of optical accuracy.

Additional Info:

Available in 1 design

Fitting Height:

16mm & 19mm

SHAMIR reLax™

Relax™, is our latest Freeform® design, created to provide single vision and pre-presbyopic patients a solution for visual fatigue. Yes, this Fatigue Relief lens provides patients just enough ADD Power in the lower portion of the lens to ease the strain felt by prolonged accommodation. With Relax™, patients' lens accommodations will be reduced by up to 30%. If your single vision patients weren't fully energized at the end of a long day before, they will be with Relax™.
